From chat to code, part 1

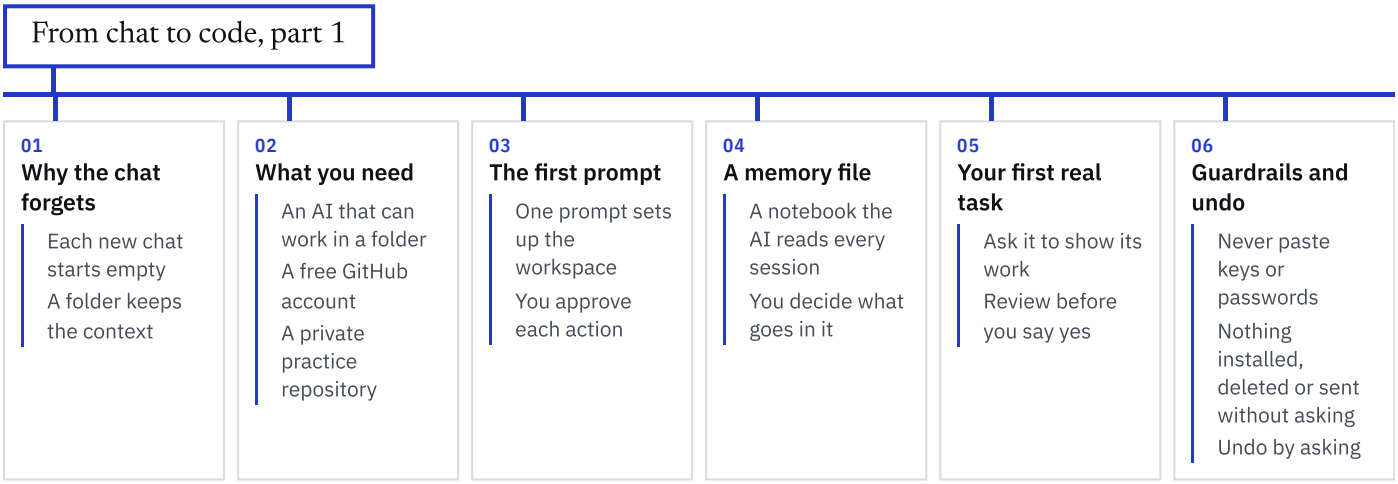

The first long video of the series: prompts you paste, and the AI does the work.

PLANNED

What you will learn

If you use ChatGPT or Claude in a chat window every day, you know the feeling: each new chat starts from zero, and you explain your project again. This first long video shows another way to work. You paste a few prompts, and your AI sets up a private folder, writes a memory file it reads every time, and does a first real task while you watch and approve each step. You will not type a single command. You will learn what to expect at each stage, how long it takes, what can go wrong, and how to undo it. Claude Code is the worked example; the ideas carry over to other tools.
