ASSETS · AI

Your first Claude environment

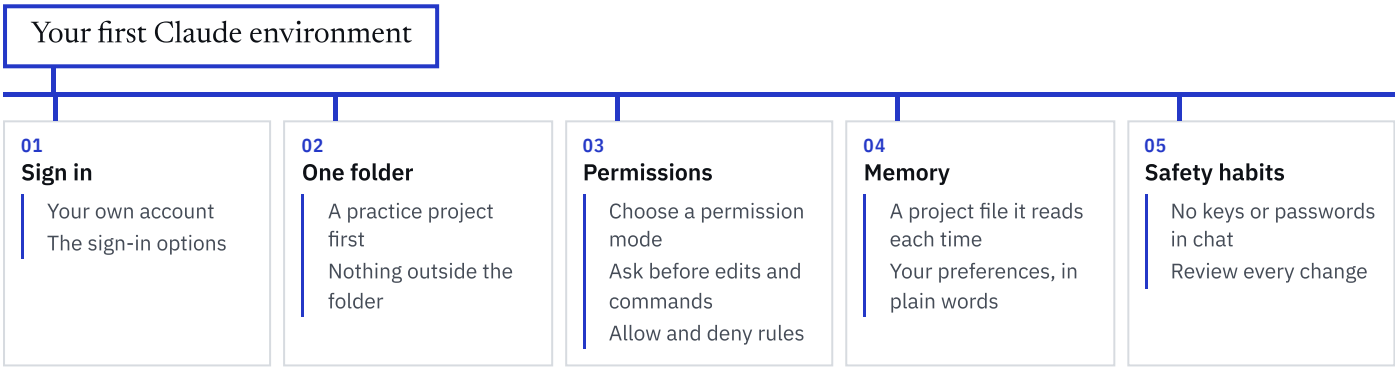

Set up a place where Claude can read and change your files safely.

PLANNED

What you will learn

Before your AI can help with real files, it needs a place to work: one folder, with clear limits on what it may do. This piece walks through setting up that place, with Claude Code as the example. You will see how to sign in, how to open a project folder, how to choose which actions it may take without asking you, and how a short memory file keeps your preferences between sessions. The focus is safety: start in a practice folder, keep keys out of the chat, and read every change before you accept it. By the end you have a workspace you understand and trust.
