Indicator 1: regime traffic light

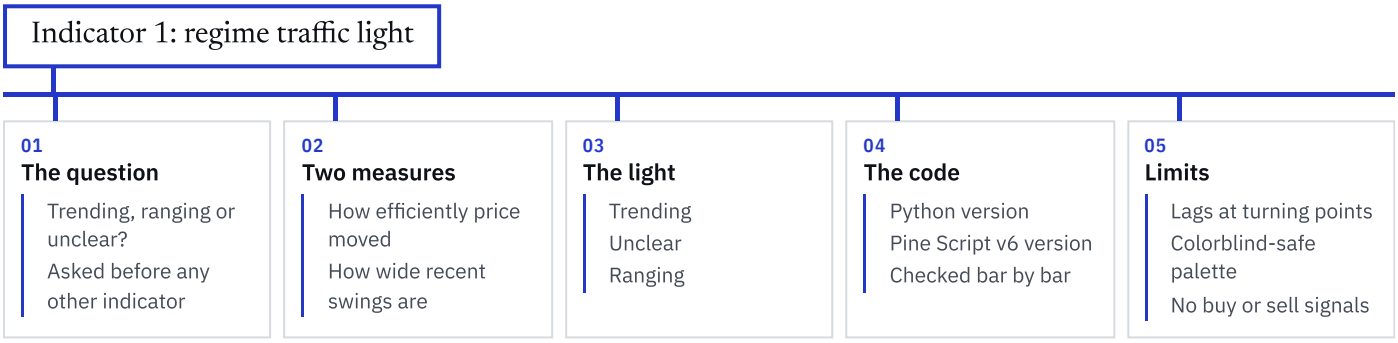

An open indicator that labels the market's state, with its code in Python and Pine v6.

PLANNED

What you will learn

Many indicators assume the market is trending, and they struggle when it moves sideways. This open indicator asks an earlier question: what state is the market in right now? It labels each period as trending, ranging or unclear, like a traffic light, using two plain measures: how efficiently price has moved, and how wide its recent swings are compared with their own history. You get the code in Python and in Pine Script v6, the rules in words, colors that work for colorblind readers, and the cases where it gets things wrong. It describes the market and gives no buy or sell signals.
