ASSETS · AI

Your first commit

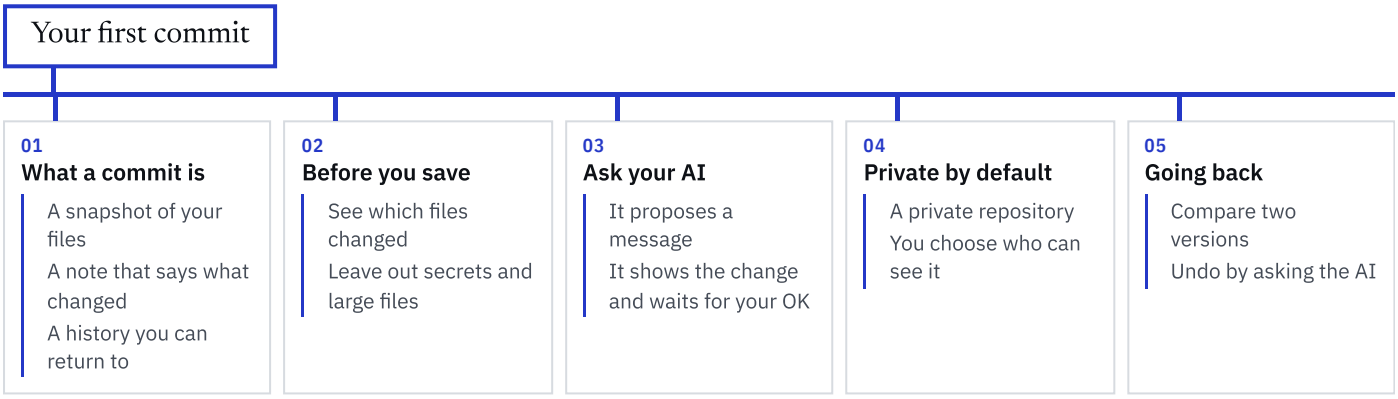

Save a first version of your work in a private repository.

PLANNED

What you will learn

A commit is a saved snapshot of your work, with a short note saying what changed. Once you have one, you can always go back. In this piece you ask your AI to make the first commit in a private repository, read the note it proposes, and check what was saved before you agree. You will see the difference between a file that changed and a change that was saved, and why small commits with clear messages make mistakes cheap to fix. There are no commands to memorize: the AI runs them and explains each one in plain words.

Map of the piece
